Multi-Factor Authentication
170.315(d)(13)

Yes, the product supports the authentication, through multiple elements, of the user's identity with the use of industry-recognized standards. When sending a controlled prescription through the RXNT web version, a two-factor authentication screen will appear prompting credentialed physicians to enter their RXNT login password and approve a verification via push notification through the ID.me Authenticator app. When prescribing a controlled substance with the RXNT mobile apps, a two-factor authentication screen will appear prompting credentialed physicians to enter their RXNT login password and verify their identity using 1Kosmos LiveID. In addition, users are required to input an OTP to access their account. After entering their username and password, users are prompted to choose whether to receive their OTP by text message or email. Texts are sent to the cell phone number on file for the user and emails are sent to the email address on file for the user. The OTP must then be entered into the RXNT login screen to access the system.
